

RUNNING AN APPLICATION:

1. Switch to the z/OS project perspective.
2. Defining the launch configuration that includes specific environment variables or input parameters for the executable file.
 - a. On the workbench toolbar, click and select the run option.
 - b. In the configuration list, click compiled application and then click the new launch configuration icon.
 - c. In the name field, type a name for the launch configuration. This name will be added to a list of options under a run with configuration menu. Choose a name that you can associate with the program, input parameters, and environment variable values that are defined in the launch configuration
 - > On the main tab, it defines the Project, Program name, and Program parameters in the respective fields.
 - > On the system environment tab, it specifies values for environment variables that the executable queries at run time.
 - > On the common tab, define the type of launch configuration and the perspective which we want to use for each launch mode.
3. Click apply and close.
4. Run the program.
 - > In the projects view, find the executable file that you want to run.
 - a. Right-click the executable file and select Run with Configuration > (launch configuration name which is defined previously).
