OUTPUT COMMAND:

-> Direct the output from a job to your terminal. The output includes the job's JCL (job control language statements, MSGCLASS (system messages) and the system output(SYSOUT) data sets.

-> Direct the output from a job to a specific data set.

-> The output for jobs has to be deleted.

-> Change the output classes for a job.

-> Route the output for a job for printing by the subsytem.

-> Release the output for a job for printing by the subsytem.

Output is a foreground initiated background(FIB) command.

This command is used in conjunction with SUBMIT, STATUS, and CANCEL commands.

The output command applies to all jobs whose job names begin with your user identification. Access to jobs whose job names do not begin with a valid used identification must be provided by an installation written exit routine.

The SUBMIT, STATUS and CANCEL commands apply to batch jobs.

We must have special permission to use these commands.
